Beth,

1. Bis (2-ethylhexyl) phthalate is a common lab contaminant, especially when reported at low concentration like this. I would say the detection is either from lab or possibly any plastic the material came in contact with. The concentration is minimal
2- Barium is occasionally detected in metals blanks. The concentration is <1/2 the RL with a sample result 9X the RL so there is no reason to be concerned. The lab is required to use the B flag by the method. Based on the data a validator would drop it.
3-Chromium is also occasionally detected in blanks, especially with the very low RLs in this report. The MB concentration is <1/2 the RL. For the solids analysis, the reported concentration is approximately 2X the RL and almost 10X the blank result-so again there is no effect on the data. In the TCLP, the reported results are significantly below the LDR so there is no effect on the comparison to the result.

Hope this answers his questions.

Guy

Guy,

Gary has the following questions in regard to this lime analysis attached:

Could you ask your chemist about the following:

Bis (2-ethylhexyl) phthalate: typical lab contaminant?

Barium: B Qualifier – Why would this be in the blank?

Chromium: B Qualifier – Why would this be in the blank?

Thanks,

Beth Crawford

Hello,

Attached please find the report files for job 600-109659-1; Lime - 041015

Please feel free to contact me if you have any questions.

Thank you.
